

## PATIENT CONTROLLED ANALGESIA FLOW SHEET

<b>DATE</b>								
<b>TIME</b>								
<b>Medication</b>								
<b>Continuous Infusion</b> (mg/hr)								
<b>PCA mg/dose</b>								
<b>Lockout minutes</b>								
<b>4 Hour Limit</b>								
<b>New Syringe</b>								
<b>Demands Requested</b>								
<b>Demands Delivered</b>								
<b>PCA Cleared?</b>								
<b>Dose Infused on shift</b>								
<b>Total Dose Infused</b>								
<b>Respiratory Rate</b>								
<b>Sedation Scale</b>								
<b>PAIN (0-10)</b>								
<b>I.V. Patent</b>								
<b>INITIALS</b>								

### SEDATION LEVEL

1- Awake   2- Drowsy   3- Dozing and easily awakened  
 4- Awakens to name call or gentle shake   5- Hard to arouse

### 0-10 SCALE FOR PAIN

This is a uniform way of tracking your patient's pain and is unique for each patient. 0 is essentially no pain, and 10 is the worst pain that they have ever experienced. The goal is to have the patient's pain level at a 5 or less with the use of the PCA pump.

### FREQUENCY

Assessments are to be started when the PCA is initiated, then every hour for 2 hours, then every 2 hours for 4 hours, then every 4 hours as long as the patient is receiving the PCA. Additional assessments will be done when the syringe is changed or when the PCA pump is cleared.
